# Outline

- ▶ Goals
- ▶ Sites
- ▶ Model
- ▶  $MP_1$  Results
- ▶ SNR Results
- ▶ Position Results
- ▶ Conclusions

Outline

Goals

Sites

Model

SNR

Position

Conclusion

# Goals

- ▶ Generate an index representative of snow cover over GPS antenna.
- ▶ Considerations for Reflections study:
  - ▶ How much of an effect will Snow cover directly over the antenna have on received signal power from lower elevation angles.

Outline

Goals

Sites

Model

SNR

Position

Conclusion

## Sites for Primary Study

- ▶ P360 \*
- ▶ P101 \*
- ▶ AB33
- ▶ P455

*\* sites have a digital camera installed on site.*

# Model

- Basic EM wave propagation (Plane solution to Maxwell's Equations)

$$E = E_0 e^{j(k \cdot r - \omega t)}, \quad (1)$$

Where,

$$\frac{\omega^2}{k^2} = \frac{c^2}{\epsilon}$$

However, If  $\epsilon$  is complex

$$E = E_0 \exp[j(\text{Re}(k) \cdot r - \omega t)] \exp[-\text{Im}(k) \cdot r]. \quad (2)$$

Outline

Goals

Sites

Model

SNR

Position

Conclusion

- ▶ Dielectric of Snow?
  - ▶ Phase velocity in a medium is dependent on the frequency of the wave-front.
  - ▶ As a consequence the dielectric constant of a medium is dependent on the frequency of the EM-wave.
  - ▶ Phase velocity of the wave is given by

$$v = \frac{\omega}{k} = \frac{c}{n}$$

Where,  $n$  is the refractive index of the the medium

$$n = \sqrt{\epsilon}$$

- ▶ Dielectric of Snow for GPS L1 frequency?

# Model - $\epsilon$ for Snow

Outline

Goals

Sites

Model

SNR

Position

Conclusion

- ▶ Snow is a mixture of Ice, Air and Water.
- ▶ From [1]
  - ▶ Consider a 2 component mixture: ice and air
  - ▶ Let their volume fractions be  $p_i$  and  $p_a = (1 - p_i)$
  - ▶ let their dielectric constants be  $\epsilon_i$  and  $\epsilon_a$
  - ▶ The Dielectric constant of the combination is given by,

$$\epsilon_s E_s = \epsilon_i p_i E_i + \epsilon_a p_a E_a \quad (3)$$

- ▶ Where  $E_s$ ,  $E_i$  and  $E_a$  is the mean electric field strength for the EM wave under consideration in the different media.

[1] Y. Ozawa and D. Kuroiwa, "**Dielectric Properties of ice, snow and supercooled water**" in *Microwave propagation in Snowy districts*, no. 6, pp. 31-71, 1971

# Model - $\epsilon$ for Snow

- From [2]

- The Dielectric constant of the combination is given by,

$$\epsilon_s = \epsilon'_s - j\epsilon''_s$$

Where

$$\epsilon'_s = 1 + 2\rho_d$$

$$\epsilon''_s = \epsilon'_s \times 1.59 \times 10^6 \times \frac{0.52\rho_d + 0.62\rho_d^2}{7 + 1.7\rho_d + 0.7\rho_d^2} \\ \times (f_{L1}^{-1} + 1.23 \times 10^{-6} \sqrt{f_{L1}}) e^{0.036T}$$

- Where,

$\rho_d$  is relative density of dry snow

$T$  is the temperature of snow in Celsius.

Conclusion

- ▶ J. Stepanek, and W.C David, "**GPS signal reception under snow cover: A Pilot study establishing the potential usefulness of GPS in avalanche search and rescue**", Wilderness and Environmental Medicine, 8, pp. 101-104, 1997
  - ▶ Antenna buried under snow cover of incremental depths
    - ▶ 5,15,25,35,45,55cm, 1m, 1.5m
  - ▶ parameters measured: signal quality, number of satellites visible and signal strength
  - ▶ reference reading taken above snow cover
  - ▶ No SNR data.
  - ▶ deals with signal quality flag from commercial receiver

**Table 1.** Location A, February 10, 1996, snow density 0.6 g/cm<sup>3</sup>, humidity 78%, skycover 6/8, temperature 34°F

	<i>Cover</i>	<i>Reference</i>	<i>Depth of burial (cm)</i>

## SNR Data – P360 – PRN12 – DoY 33–90/2012

[Outline](#)[Goals](#)[Sites](#)[Model](#)[SNR](#)[Position](#)[Conclusion](#)

# SNR

Outline

Goals

Sites

Model

SNR

Position

Conclusion

- ▶ Generate a statistical map of expected SNR values w.r.t Elevation angle.
- ▶ Data from 2011 DOY 200-250 was used to generate the map
- ▶ Each SV was considered separately
  - ▶ Individual Tracks could be tagged as 'Bad'
  - ▶ Each SV has varying transmit power

# SNR Map

*32 lines – > mean SNR for every SV, along with error bars.*
